

Distribution of Box Office Revenue

This pie chart shows the distribution of box office earnings across 11,000 movies. It implies that most movies do not make more than \$2 Million. However, there are some things to consider before making a conclusion:

1. This chart does not show production costs, so we do not know what the profit margin is.
2. Due to inflation, newer movies would cost more to produce and tickets for newer movies will cost more. This affects the real earnings (Revenue adjusted with inflation).
